Throughout this manual, there are a number of HAZARD WARNINGS that must be read and adhered to in order to prevent possible personal injury and/or damage to equipment. Two signal words "WARNING" and "CAUTION" are used to indicate the severity of a hazard and are preceded by the safety alert symbol.

⚠️ **WARNING**
Used when serious injury or death MAY result from misuse or failure to follow specific instructions.

⚠️ **CAUTION**
Used when minor or moderate injury or product / equipment damage MAY result from misuse or failure to follow specific instructions.

**NOTICE**
Indicates information considered important, but not hazard-related.

It is the responsibility of all personnel involved in installation, operation and maintenance to fully understand the ⚠️ Warning and ⚠️ Caution procedures by which hazards are to be avoided.

**Models: BSB53, BSD53**

Aerovent Catalog 631 provides additional information on this equipment. This catalog can be found at www.aerovent.com or by contacting your local Aerovent sales representative.
Receiving, Unpacking & Inspection

When the equipment is received all items should be carefully checked against the bill of lading to be sure all crates and cartons have been received. Before accepting delivery, carefully inspect each carton or crate for visible shipping damage. If any damage is noticed, the carrier should make the proper notation on the delivery receipt acknowledging the damage. Make notations of all damage on all copies of the bill of lading and have all copies countersigned by the delivering carrier. The carrier should also fill out a Carrier Inspection Report. The factory Traffic Department should then be contacted. File claim for damage with the carrier. Physical damage to the unit after acceptance is not the responsibility of Aerovent.

Unpack each carton or crate and verify that all required parts and proper quantities of each item have been received. Refer to drawings for part descriptions. Report shortages or missing items to your local representative to arrange for replacement parts.

Due to availability of carriers and truck space, it is not possible to guarantee that all items will be shipped together. Verification of shipments must be limited to only those items on the bill of lading.

Storage

If fans are stored for any length of time, they should be stored in a clean, dry location to prevent rust and corrosion. Outdoor storage is not recommended. When outdoor storage is necessary, fans should be protected from the elements as completely as possible. Cover the fan inlet and outlet and keep motors dry and clean.

For extended storage (more than 3 months) motor shafts and bearings should be rotated monthly. If stored longer than 6 months, bearing grease in motor and fan should be purged and replaced with compatible grease. Belts should be rechecked for proper tension. Storage records should be kept to assure proper maintenance. The factory can advise warranty centers to provide motor and bearing service if needed.

Limitation of Warranties and Claims

Seller warrants to the original purchaser that the goods sold hereunder shall be free from defects in workmanship and material under normal use and service (except in those cases where the materials are supplied by the buyer) for a period of one year from the date of original installation or eighteen (18) months from the date of shipment, whichever occurs first. The liability of seller under this warranty is limited to replacing, repairing, or issuing credit (at cost, F.O.B. factory and at seller’s discretion) for any part or parts which are returned by buyer during such period provided that:

a. seller is notified in writing within ten (10) days following discovery of such defects by buyer, or within ten (10) days after such defects should reasonably have been discovered, whichever is less;
b. the defective unit is returned to seller, transportation charges prepaid by buyer;
c. payment in full has been received by seller for said products;
d. seller’s examination of such unit shall disclose to its satisfaction that such defects have not been caused by misuse, neglect, improper installation, repair, alteration, act of God, or accident.

No warranty made hereunder shall extend to any seller product whose serial number is altered, effaced or removed. Seller makes no warranty, express or implied, with respect to motors, switches, controls, or other components of seller’s product, where such components are warranted separately by their respective manufacturers. THIS WARRANTY IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, WHETHER STATUTORY OR OTHERWISE, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. In no event shall seller be liable to buyer for indirect, incidental collateral, or consequential damages of any kind. (BUYER’S FAILURE TO PAY THE FULL AMOUNT DUE WITHIN SIXTY (60) DAYS OF DATE OF INVOICE SHALL OPERATE TO RELEASE SELLER FROM ANY AND ALL LIABILITY OR OBLIGATION ARISING PURSUANT TO ANY WARRANTY, EXPRESS OR IMPLIED, WHETHER STATUTORY OR OTHERWISE, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, MADE IN CONNECTION WITH ANY CONTRACT FORMED HEREUNDER. BUYER AGREES THAT SUCH FAILURE TO PAY SHALL CONSTITUTE A VOLUNTARY WAIVER OF ANY AND ALL SUCH WARRANTIES ARISING PURSUANT TO SUCH CONTACT.)
Installation

Models BSD53 and BSB53 are all designed to be lifted onto the building by using the windband brackets which double as lifting points for these models. Units can be lifted onto the building with or without the windband mounted onto the unit. Straps or chain capable of handling the load of the unit should be securely attached to each of the four windband brackets.

Once the fan has been carefully lifted onto the roof curb, it should be secured by installing fasteners into all of the holes provided in the base of the fan.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>The unit should not be lifted by any other parts such as drive frame, motor, damper blades, windband, orifice panel, curb cap, etc.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Units with the fusible link assembly are under extremely high spring tension. Care must be taken to not accidentally set off the damper lifters when servicing the fan. The fusible link damper lifters are located under the butterfly damper blades. Failure to exercise caution could cause severe injury or death.</td>
</tr>
</tbody>
</table>

Accessibility

Motor and drive assemblies on models BSB53 and BSD53 can be accessed from the roof by removing the stack cap and orifice panel assemblies from the roof curb. A hinged base is available as an accessory on sizes 36 and below to allow for easier access from the roof.

Electrical Connection

1. Connect supply wiring to a disconnect switch. Check the wiring diagrams on the motor for connections.

2. The motor is factory set at the voltage marked on the fan nameplate. Check the line voltage with the nameplate voltage and wiring diagrams.

3. The main power wiring should be sized for the ampacity shown on the dataplate. Size wires in accordance with the ampacity tables in Article 310 of the National Electrical Code. If long wires are required, it may be necessary to increase wire size to prevent excessive voltage drop. Wires should be sized for a maximum of 3% voltage drop.

4. (Optional) Disconnect switches are not fused. The power leads must be protected at the point of distribution in accordance with the fan dataplate.

5. On fans without a thermal protector integral to the motor (refer to unit or motor dataplate to determine if protector is present) a separate overload device is required. Refer to Sections 430-32 of the N.E.C. for sizing.

6. All units must be electrically grounded in accordance with local codes or, in the absence of local codes, with the latest edition of the National Electrical Code (ANSI/NFPA 70). A ground lug is provided as standard in the unit terminal box. Size grounding conductor in accordance with Table 250-95 of the National Electrical Code. DO NOT use the ground lug for connecting a neutral conductor.

7. Supply voltage to the power ventilator should not vary by more than 10% of the value indicated on the unit dataplate. Phase unbalance must not exceed 2%.

---

Check, Test & Start Procedure

1. Check to verify that the propeller is free to rotate.

2. Verify that supply voltage on the line side of disconnect agrees with voltage on fan data plate and is within the 10% utilization voltage.

3. Apply power to unit and check rotation of propeller with the directional arrow on the unit.

4. Electrical Input Check: Perform check of fan ampere draw and verify that motor nameplate amps are not exceeded. Take into account the service factor range if motor is nameplated above a 1.0 service factor.

5. Fan RPM should be checked and verified with a tachometer.

---

Electrical Connection

Use copper conductors only.
Protect wiring from sharp edges. Leave some slack in the line to prevent damage.

---

Check units for rotation. For three-phase, rotation can be changed by interchanging any two of the three line leads. If unit is checked on temporary wiring, it should be rechecked when permanently installed. Motor burn-out or tripped overload protection devices are usually the result of wrong rotation.

---

Failure of motor due to operation on improper line voltage or with excessive phase unbalance constitutes product abuse and may cause severe damage to the unit’s electrical components.

---

WARNING

Electric shock hazard. Could cause severe injury or death. Failure to bond the frame of this equipment to the building electrical ground by use of the grounding terminal provided or other acceptable means may result in electrical shock. Disconnect electric power before servicing equipment. Service to be performed only by qualified personnel. Before start-up, make sure power is turned off and locked in the OFF position.

---

Rotation is critical. If allowed to operate in the wrong direction, the motor will overload and burn out.

---

The fan was balanced at the factory to be within stringent vibration levels before shipment. However, there are several things that may cause vibration, such as rough handling in shipment and installation, weak foundations and alignments.
Installation and maintenance are to be performed only by qualified personnel who are familiar with local codes and regulations and experienced with this type of equipment.

Preventive maintenance is the best way to avoid unnecessary expense and inconvenience. Start-up and routine maintenance should cover the following items:

a. Tighten all setscrews, bolts and wire connections.
b. Check belt tension and sheaves for wear.
c. Lubricate fan bearings (see Tables 1 and 2).
d. Cleaning of unit, propeller and damper (if present).

All motors containing ball bearings are permanently lubricated from the factory. No additional maintenance is required.

1. Before performing any maintenance on the fan, be sure power is turned off and locked in the OFF position at the service entrance.
2. Ventilators should be carefully checked at least once a year. For critical or rugged applications, a routine check every two or three months is suggested.
3. For repairs within the warranty period, the motor must be taken to the motor manufacturer’s authorized service dealer.
4. A periodic motor check should consist of spinning the motor shaft with the power off to be sure the motor turns freely and the bearings run smoothly. The belt on belt driven units should be removed from the motor sheave.
5. When removing or installing a belt, do not force the belt over the sheave. Loosen the motor mount so that the belt can be easily slipped over the sheave. (For Notes 5-9, refer to page 7.)
6. The belt on belt driven units should be removed and carefully checked for glazing, cracks, ply separation or irregular wear. A small irregularity in the contact surface of the belt will result in noisy operation. If any of these defects are apparent, the belt should be replaced. Check the sheaves also for chipping, dents or rough surfaces which could damage the belt.
7. The correct belt tension is important. Too tight of a belt will result in excess bearing pressure on the motor bearings and shaft pillow blocks and may also overload the motor. Too loose of a belt will result in slippage which will quickly “burn” out belts. A belt should feel “live” when thumped, approximately ¼” belt deflection (3 to 5 lb.) when subject to finger pressure at midpoint between sheaves.
8. The belt alignment should also be checked to be sure the belt is running perpendicularly to the rotating shafts. Fan and motor shafts must be parallel. Improper alignment will result in excessive belt wear.
9. Check sheave setscrews to ensure tightness. Proper keys must be in keyways.
10. For blade angle adjustments on Type ‘E’ Propellers (Level 3), refer to Engineering Supplement ES-404.
11. If unit is to be left idle for an extended period, it is recommended that belts be removed and stored in a cool, dry place to avoid premature belt failure.
12. The standard pillow block bearings on belt driven ventilators are factory lubricated and are provided with external grease fittings. Annual lubrication is recommended, or more frequently if needed (see Table 1).

It is recommended to add fresh grease at start-up. Use only 2 or 3 shots of a recommended lubricant with a hand gun in most cases (see Table 2). Maximum hand gun rating 40 P.S.I. Rotate bearings during lubrication where good safety practice permits.

Greases of different soap bases (lithium, sodium, etc.) may not be compatible when mixed. Prevent such intermixing by completely purging the bearing of old greases.

The most frequent causes of bearing failure are not greasing often enough, using an excessive quantity of grease or using incompatible greases. Excessive vibration, especially if the bearing is not rotating, will also cause bearings to fail. Bearings must also be protected from water and moisture to avoid internal corrosion.

13. During the first few months of operation it is recommended that the bearing setscrews be checked periodically to ensure that they are tight.
14. The rotating propeller requires particular attention since materials in the air being handled can build up on the blades to cause destructive vibration or weaken the structure of the propeller by corroding and/or eroding the blade metal. Regular inspection and corrective action at intervals determined by the severity of each application are essential to good service life and safety.

15. Filter Maintenance (Filtered Supply Fans)
Inspect the 2" Aluminum Mesh Filters on a regular basis. Clogged filters can adversely affect air performance.

Bearing Replacement

Fan bearings on belt driven fans should not need to be replaced for many years if the previous recommendations are strictly adhered to. However, use the following procedure when bearing replacement is necessary.

1. Gain access to the fan bearings. Remove the bearing cover, if any.
2. Loosen the belts by shifting the motor.
3. Remove the propeller and disconnect the remote lubrication tubes (if applicable).
4. Measure the location of the bearing to the propeller end of the shaft and the bearing spacing.
5. Remove the shaft and bearing assembly. Note the position of the bearings’ shims (if applicable).
6. Loosen all bearing/shaft setscrews or other locking devices.
7. Remove bearings (may need to be pressed off the shaft).
8. Polish the shaft with fine emery paper (240 grit or finer) and file the setscrew dimples left on the shaft flat.
9. Install new bearings on the shaft, making sure that the collars are together (i.e. facing each other on the shaft). Lightly seat one setscrew or eccentric locking collar on each bearing to hold in the approximate marked position.
10. Mount the shaft/bearing assembly in the fan with bolts. Do not tighten yet. Just snug up. Loosen the setscrew.
11. Center the shaft in the housing (both ends) as closely as possible. (The fan propeller may need to be temporarily installed to get its clearances equal.)
12. Lubricate bearings. See Tables 1 and 2, Page 5.
13. Tighten setscrews in steps (alternating half turns). Note torquing requirements with bearing instructions.
14. Tighten the bearing mounting bolts.
15. Reinstall the lube tubes (if applicable).
16. Install propeller and belts and adjust the motor to get proper belt tension. Also, make sure that the sheaves are properly aligned.
17. If a new shaft is supplied, ignore items 6 thru 8.

Motors

Aerovent recommends periodic checks of voltage, frequency and current of a motor while in operation. Such checks assure the correctness of frequency and voltage applied to the motor, and yield an indication of the fan load. Comparison of this data with previous data will give an indication of the fan performance. Any serious deviations could indicate a potential motor failure.

All motors have prelubricated sealed bearings and are lubricated for the life of the motor.

1. All motors carry a limited warranty from the motor manufacturer. For repairs within the warranty period, the motor must be taken to the motor manufacturer’s authorized service dealer. Contact your representative for additional warranty details.
2. A periodic motor check should consist of spinning the motor shaft with the power off to be sure the motor turns freely and the bearings run smoothly. The belt on belt driven units should be removed from the motor pulley.

Repair or replacement of motors is normally performed by a repair station authorized by the manufacturer. Contact your representative or the factory for locations nearest you. DO NOT ship motor to the factory without specific authorization forms.
V-Belts

V-belts on these belt driven fans are oil, heat, and static resistant type and oversized for continuous duty. With proper installation and maintenance, years of operating efficiency can be added to the lifespan of the V-belt drive.

The condition of V-belts and the amount of belt tension should be checked prior to start-up (see Figure 1). When it becomes necessary to adjust belt tension, do not over-tension as bearing damage will occur. Recommended belt tension should permit \( \frac{3}{8} \)” deflection per inch of span of the belt at the center of the belt span. To find this point, measure halfway between the pulley centerlines as shown in Figure 2. Extreme care must be exercised when adjusting V-belts as not to misalign the pulleys. Any misalignment will cause a sharp reduction in belt life and will also produce squeaky, annoying noises (see Figure 3). On units equipped with 2-groove pulleys, adjustments must be made so that there is equal tension on all belts (see Figure 5).

1. Where tensioning rods are not available, adjustment is more easily obtained by loosening and adjusting one side of the motor bracket at a time.
2. Always loosen tension adjustment enough to place belts on sheaves without running belts over the edge of either sheave. A new belt may be seriously damaged internally by careless handling (see Figure 4).

**WARNING**

When removing or installing belts, never force belts over pulleys without loosening motor first to relieve belt tension.

3. Fan speed can be increased by closing the adjustable motor pulley, or decreased by opening it. Two and three groove adjustable pitch pulleys must be adjusted an equal number of turns. (See Figure 5). Always check load on motor when increasing fan speed.

---

**Figure 1. Eliminate Slack**

 Slack belts wear excessively, cause slippage and deliver less power. For longest belt life, always provide proper tension

**Figure 2. Belt Deflection**

\[
\text{Deflection} = \frac{\text{Belt Span}}{64}
\]

**Figure 3. Alignment**

Correct

Incorrect

Mount belts straight. Shafts must be parallel and sheaves in alignment to prevent unnecessary belt wear.

**Figure 4. Belts**

Do not force belt. Forcing the belt will break the cords and cause belt failure.

**Figure 5. 2-Groove Sheaves**

Two-groove variable pitch sheaves must be opened the same number of turns on both sides; otherwise, slippage occurs, wearing belts rapidly.
# Fan Troubleshooting Chart

<table>
<thead>
<tr>
<th>PROBLEM</th>
<th>POSSIBLE CAUSES</th>
</tr>
</thead>
</table>
| FAN DOES NOT OPERATE          | 1. Wrong voltage.  
                                     | 2. Electricity turned off or not wired properly.  
                                     | 3. Tripped overload protector.  
                                     | 5. Loose pulleys.  
| TOO LITTLE AIR                | 1. Propeller rotating in wrong direction.  
                                     | 2. Fan speed lower than design.  
                                     | 3. System is more restrictive (more static pressure) than expected.  
                                     | 4. Restricted fan inlet or outlet.  
                                     | 5. Inlet or outlet screens clogged.  
                                     | 6. Filters, if applicable, are dirty or clogged. |
| TOO MUCH AIR                  | 1. Fan speed higher than design.  
                                     | 2. System is less restrictive (less static pressure) than expected.  
                                     | 3. Filters, if applicable, not in place. |
| EXCESSIVE HORSEPOWER          | 1. Propeller rotating in wrong direction.  
                                     | 2. Propeller rubbing on inlet venturi.  
                                     | 3. Fan speed higher than design.  
                                     | 4. Worn fan bearings. |
| EXCESSIVE NOISE               | 1. Propeller or sheaves loose.  
                                     | 2. Bearing or drive misalignment.  
                                     | 3. Accumulation of material on propeller.  
                                     | 4. Worn or corroded propeller.  
                                     | 5. Propeller out of balance.  
                                     | 6. Propeller hitting housing.  
                                     | 8. Bearings need lubrication.  
                                     | 9. Loose bearing bolts.  
                                     | 10. Loose or worn bearings.  
                                     | 11. Mismatched belts.  
                                     | 12. Belts too loose or too tight.  
                                     | 13. Belts oily or dirty.  
                                     | 15. Loose fan mounting bolts.  
                                     | 16. Rattle of components in high velocity airstream.  
                                     | 17. Vibrating parts not isolated from building.  
                                     | 18. Noise from high velocity air system.  
                                     | 20. Vibrating ductwork. |
| EXCESSIVE VIBRATION            | 1. Propeller or sheaves loose on shaft.  
                                     | 2. Propeller out of balance.  
                                     | 3. Excessive buildup of dirt/dust on propeller.  
                                     | 4. Belts too loose or too tight.  
                                     | 5. Mismatched belts.  
                                     | 7. Bearing or drive misalignment.  
                                     | 8. Loose or worn bearings.  
                                     | 10. Structures not cross-braced. |

It is recommended that the users and installers of this shipment familiarize themselves with AMCA Publication #201, “Fans and Systems” and publication #202, “Troubleshooting” which are published by the Air Movement and Control Association (AMCA), 30 West University Drive, Arlington Heights, Illinois 60004. www.amca.org
